Introduction

Motivating linear algebra

Même le feu est régi par les nombres.

Fourier¹ studied the transmission of heat using tools that would later be called an eigenvector-basis. Why would he say something like this?

¹Jean Baptiste Joseph Fourier (1768-1830)

Matrices

 $\mathbf{A} \in \mathbb{R}^{m,n}$ is a real-valued Matrix with m rows and n columns.

$$\mathbf{A} = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{pmatrix}, a_{ij} \in \mathbb{R}.$$
 (1)

3

Essential operations

Addition

Two matrices $\mathbf{A} \in \mathbb{R}^{m,n}$ and $\mathbf{B} \in \mathbb{R}^{m,n}$ can be added by adding their elements.

$$\mathbf{A} + \mathbf{B} = \begin{pmatrix} a_{11} + b_{11} & a_{12} + b_{12} & \dots & a_{1n} + b_{1n} \\ a_{21} + b_{21} & a_{22} + b_{22} & \dots & a_{2n} + b_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} + b_{m1} & a_{m2} + b_{m2} & \dots & a_{mn} + b_{mn} \end{pmatrix}$$
(2)

4

Multiplication

Multiplying $\mathbf{A} \in \mathbb{R}^{m,n}$ by $\mathbf{B} \in \mathbb{R}^{n,p}$ produces $\mathbf{C} \in \mathbb{R}^{m,p}$,

$$\mathbf{AB} = \mathbf{C}.\tag{3}$$

To compute ${\bf C}$ the elements in the rows of ${\bf A}$ are multiplied with the column elements of ${\bf C}$ and the products added,

$$c_{ik} = \sum_{j=1}^{n} a_{ij} \cdot b_{jk}. \tag{4}$$

Linear Algebra for Machine Learning —Essential operations

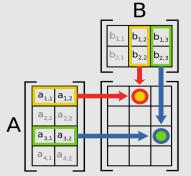

Multiplying $\mathbf{A} \in \mathbb{R}^{n,b}$ by $\mathbf{B} \in \mathbb{R}^{n,b}$ produces $\mathbf{C} \in \mathbb{R}^{n,b}$, $\mathbf{A}\mathbf{B} = \mathbf{C}. \tag{3}$ To compute \mathbf{C} the elements in the root of \mathbf{A} are multiplied with the column elements of \mathbf{C} and the products added, $c_{\mathbf{G}} = \sum_{j=1}^{n} a_{j} \cdot b_{j}, \tag{4}$

Multiplication

-Multiplication

Define on the board:

- Dot product $\mathbf{a} \cdot \mathbf{b} = a_1 b_1 + a_2 b_2 + \cdots + a_n b_n$ for two vectors $\mathbf{a}, \mathbf{b} \in \mathbb{R}^n$.
- Row times column view [Str+09]:

The identity matrix

$$\mathbf{I} = \begin{pmatrix} 1 & & & \\ & 1 & & \\ & & \ddots & \\ & & & 1 \end{pmatrix} \tag{5}$$

└─The identity matrix

 $I = \begin{pmatrix} 1 & & \\ & 1 & \\ & & \ddots & \\ & & & 1 \end{pmatrix}$ (5)

Demonstrate multiplication with the inverse by hand.

$$\begin{pmatrix} -1 & 0 & 0 \\ 1 & -1 & 1 \\ 1 & 0 & -1 \end{pmatrix} \begin{pmatrix} -1 & 0 & 0 \\ -2 & -1 & -1 \\ -1 & 0 & -1 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$
 (6)

Matrix inverse

The inverse Matrix \mathbf{A}^{-1} undoes the effects of \mathbf{A} , or in mathematical notation,

$$\mathbf{A}\mathbf{A}^{-1} = \mathbf{I}.\tag{7}$$

The process of computing the inverse is called Gaussian elimination.

Linear Algebra for Machine Learning

Essential operations

└─Matrix inverse

The inverse Matrix \mathbf{A}^{-1} undoes the effects of \mathbf{A}_i or in

Matrix inverse

 $\mbox{\bf A}\mbox{\bf A}^{-1} = \mbox{\bf L}$ The process of computing the inverse is called Gaussian elimination.

Example on the board:

$$\mathbf{A} = \begin{pmatrix} 2 & 0 \\ 1 & 3 \end{pmatrix} \rightsquigarrow \begin{pmatrix} 2 & 0 & 1 & 0 \\ 1 & 3 & 0 & 1 \end{pmatrix} \rightsquigarrow \begin{pmatrix} 1 & 0 & \frac{1}{2} & 0 \\ 1 & 3 & 0 & 1 \end{pmatrix} \tag{8}$$

$$\rightsquigarrow \begin{pmatrix} 1 & 0 & \frac{1}{2} & 0 \\ 0 & 3 & -\frac{1}{2} & 1 \end{pmatrix} \rightsquigarrow \begin{pmatrix} 1 & 0 & \frac{1}{2} & 0 \\ 0 & 1 & -\frac{1}{6} & \frac{1}{3} \end{pmatrix} \tag{9}$$

Test the result:

$$\begin{pmatrix} 2 & 0 \\ 1 & 3 \end{pmatrix} \begin{pmatrix} \frac{1}{2} & 0 \\ -\frac{1}{6} & \frac{1}{3} \end{pmatrix} = \begin{pmatrix} 2 \cdot \frac{1}{2} + 0 \cdot -\frac{1}{6} & 2 \cdot 0 + 0 \cdot \frac{1}{3} \\ 1 \cdot \frac{1}{2} + 3 \cdot -\frac{1}{6} & 0 \cdot 0 + 3 \cdot \frac{1}{3} \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$$
(10)

The Transpose

The transpose operation flips matrices along the diagonal, for example, in \mathbb{R}^2 ,

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix}^T = \begin{pmatrix} a & c \\ b & d \end{pmatrix}$$
 (11)

Motivation of the determinant

- The determinant contains lots of information about a matrix in a single number.
- When a matrix has a zero determinant, a column is a linear combination of other columns. Its inverse does not exist.
- We require determinants to find eigenvalues by hand.

Computing determinants in two or three dimensions

The two-dimensional case:

$$\begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11} \cdot a_{22} - a_{12} \cdot a_{21}$$
 (12)

(13)

Computing the determinant of a three-dimensional matrix.

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11} \cdot \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{21} \cdot \begin{vmatrix} a_{12} & a_{13} \\ a_{32} & a_{33} \end{vmatrix} + a_{31} \cdot \begin{vmatrix} a_{12} & a_{13} \\ a_{22} & a_{23} \end{vmatrix}$$

$$(14)$$

Linear Algebra for Machine Learning Le

Computing determinants in two or three dimensions $\begin{aligned} & \text{The two-dimensional case.} \\ & \text{The two-dimensional case.} \\ & \text{$|a_1 \quad a_2|$} = |a_1 \cdot a_2 - a_2 \cdot a$

Computing determinants in two or three dimensions

Works for any row or column, as long as we respect the sign pattern. Example computation on the board:

$$\begin{vmatrix} -1 & 0 & 0 \\ 1 & -1 & 1 \\ 1 & 0 & -1 \end{vmatrix} = -1 \cdot \begin{vmatrix} -1 & 1 \\ 0 & -1 \end{vmatrix} - 1 \cdot \begin{vmatrix} 0 & 0 \\ 0 & -1 \end{vmatrix} + 1 \cdot \begin{vmatrix} 0 & 0 \\ -1 & 1 \end{vmatrix}$$
 (15)
$$= (-1) \cdot ((-1) \cdot (-1) - 0 \cdot 1)) -$$
 (16)
$$(0 \cdot (-1) - 0 \cdot 0) + 0 \cdot 1 - (-1) \cdot 0$$
 (17)
$$= -1$$
 (18)

Determinants in n-dimensions

$$\begin{vmatrix} a_{11} & a_{21} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{vmatrix} = a_{11} \begin{vmatrix} a_{22} & \dots & a_{2n} \\ \vdots & & \vdots \\ a_{m2} & \dots & a_{mn} \end{vmatrix} + a_{21} \begin{vmatrix} a_{21} & \dots & a_{2n} \\ \vdots & & \vdots \\ a_{m2} & \dots & a_{mn} \end{vmatrix}$$

Linear Algebra for Machine Learning

—Essential operations

—Determinants in n-dimensions

Draw the sign pattern on the board:

$$\begin{vmatrix} + & - & + & \dots \\ - & + & - & \dots \\ + & - & + & \dots \\ \vdots & \vdots & \vdots & \ddots \end{vmatrix}$$
 (19)

The determinant can be expanded along any column as long as the sign pattern is respected.

Summary

- We saw some of the most important operations in linear algebra.
- Let's use these to do something useful next.

Linear curve fitting

What is the best line connecting measurements?

Problem Formulation

A line has the form f(a) = da + c, with $c, a, d \in \mathbb{R}$. In matrix language, we could ask for every point to be on the line,

$$\begin{pmatrix} 1 & a_1 \\ 1 & a_2 \\ 1 & a_3 \\ \vdots & \vdots \\ 1 & a_n \end{pmatrix} \begin{pmatrix} c \\ d \end{pmatrix} = \begin{pmatrix} p_1 \\ p_2 \\ \vdots \\ p_n \end{pmatrix}. \tag{20}$$

We can treat polynomials as vectors, too! The coordinates populate the matrix rows in $\mathbf{A} \in \mathbb{R}^{n_p \times 2}$, and the coefficients appear in $\mathbf{x} \in \mathbb{R}^2$, with the points we would like to model in $\mathbf{b} \in \mathbb{R}^{n_p}$. The problem now appears in matrix form and can be solved using linear algebra!

The Pseudoinverse [Str+09; DFO20]

The inverse exists for square or n by n matrices. Nonsquare \mathbf{A} such as the one we just saw, require the pseudoinverse,

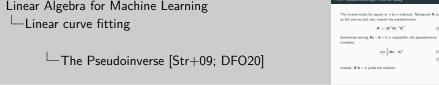

$$\mathbf{A}^{\dagger} = (\mathbf{A}^{T} \mathbf{A})^{-1} \mathbf{A}^{T}. \tag{21}$$

Sometimes solving $\mathbf{A}\mathbf{x} - \mathbf{b} = 0$ is impossible, the pseudoinverse considers,

$$\min_{\mathbf{x}} \frac{1}{2} |\mathbf{A}\mathbf{x} - \mathbf{b}|^2 \tag{22}$$

(23)

instead. $\mathbf{A}^{\dagger}\mathbf{b} = \mathbf{x}$ yields the solution.

 $\min_{\mathbf{a}} \frac{1}{2} |\mathbf{A}\mathbf{x} - \mathbf{b}|^2$

At the optimum we expect,

$$0 =
abla_{\mathbf{x}} \frac{1}{2} |\mathbf{A}\mathbf{x} - \mathbf{b}|^2$$

$$=
abla_{\mathbf{x}} \frac{1}{2} (\mathbf{A}\mathbf{x} - \mathbf{b})^3$$

$$= \nabla_{\mathbf{x}} \frac{1}{2} (\mathbf{A} \mathbf{x} - \mathbf{b})^{\mathsf{T}} (\mathbf{A} \mathbf{x} - \mathbf{b})$$

$$= \mathbf{A}^T (\mathbf{A} \mathbf{x} - \mathbf{b})$$

$$=I$$

 $(\mathbf{A}^T\mathbf{A})^{-1}\mathbf{A}^T\mathbf{b} = \mathbf{x}$

$$= A A X$$

 $A^T h = A^T A X$

$$= \mathbf{A}^T \mathbf{A} \mathbf{x} - \mathbf{A}^T \mathbf{b}$$

Sometimes solving
$$\mathbf{A}\mathbf{x} + \mathbf{b} = 0$$
 is implossible. One the board, derive:

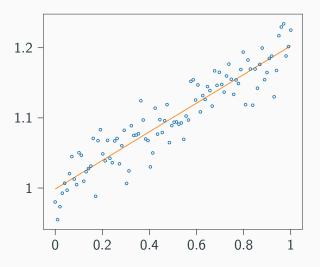

The Pseudoinverse [Str+09; DFO20

(29)

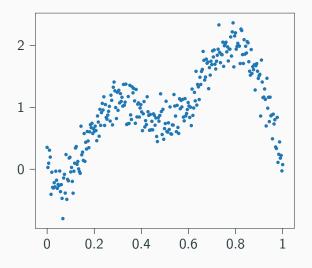

(30)

(31)

Linear regression

What about harder problems?

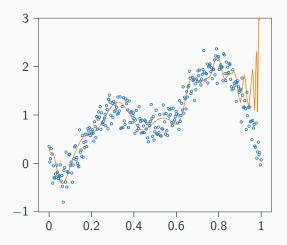

Fitting higher order polynomials

$$\underbrace{\begin{pmatrix}
1 & a_1^1 & a_1^2 & \dots & a_1^m \\
1 & a_2^1 & a_2^2 & \dots & a_2^m \\
1 & a_3^1 & a_3^2 & \dots & a_3^m \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
1 & a_n^1 & a_n^2 & \dots & a_n^m
\end{pmatrix}}_{\mathbf{A}}
\underbrace{\begin{pmatrix}
c_1 \\ c_2 \\ \vdots \\ c_m
\end{pmatrix}}_{\mathbf{x}} = \underbrace{\begin{pmatrix}
p_1 \\ p_2 \\ \vdots \\ p_n
\end{pmatrix}}_{\mathbf{b}}.$$
(32)

As we saw for the linear regression $\mathbf{A}^{\dagger}\mathbf{b} = \mathbf{x}$ gives us the coefficients.

Overfitting

The figure below depicts the solution for a polynomial of 7th degree, that is m = 7.

Summary

- We saw how linear algebra lets us fit polynomials to curves.
- For the 7th-degree polynomial the noise took over! What now?

Regularization

Motivation

- Is there a way to fix the previous example?
- To do so we start with a rather peculiar observation.

Eigenvalues and Eigen-Vectors

Multiply matrix **A** with vectors $\mathbf{x_1}$ and $\mathbf{x_2}$,

$$\mathbf{A} = \begin{pmatrix} 1 & 4 \\ 0 & 2 \end{pmatrix}, \mathbf{x}_1 = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \mathbf{x}_2 = \begin{pmatrix} 4 \\ 1 \end{pmatrix}, \tag{33}$$

we observe

$$\mathbf{A}\mathbf{x}_1 = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \mathbf{A}\mathbf{x}_2 = \begin{pmatrix} 8 \\ 2 \end{pmatrix} \tag{34}$$

Vector $\mathbf{x_1}$ has not changed! Vector $\mathbf{x_2}$ was multiplied by two. In other words,

$$Ax_1 = 1x_1, Ax_2 = 2x_2$$
 (35)

Eigenvalues and Eigenvectors

Eigenvectors turn multiplication with a matrix into multiplication with a number,

$$\mathbf{A}\mathbf{x} = \lambda \mathbf{x}.\tag{36}$$

Subtracting λx leads to,

$$(\mathbf{A} - \lambda \mathbf{I})\mathbf{x} = 0 \tag{37}$$

The interesting solutions are those were $\mathbf{x} \neq \mathbf{0}$, which means

$$\det(\mathbf{A} - \lambda \mathbf{I}) = 0 \tag{38}$$

Linear Algebra for Machine Learning —Regularization

—Eigenvalues and Eigenvectors

Eigenvelors and Eigenvectors $Eigenvectors turn multiplication with a matrix into multiplication with a number, <math display="block"> \mathbf{A} = \lambda \mathbf{x} \qquad (38)$ Subtracting $\lambda \mathbf{t}$ leads to, $(\mathbf{A} - \lambda \mathbf{J}) \mathbf{c} = 0 \qquad (37)$ The interesting solutions are those series $\mathbf{y} \cdot \mathbf{0}$, which means $\mathbf{det}(\mathbf{A} - \lambda \mathbf{J}) = 0 \qquad (38)$

On the board, compute the eigenvalues and vectors for the initial example.

$$\mathbf{A} = \begin{pmatrix} 1 & 4 \\ 0 & 2 \end{pmatrix} \rightarrow \begin{vmatrix} 1 - \lambda & 4 \\ 0 & 2 - \lambda \end{vmatrix} = (1 - \lambda) * (2 - \lambda) - 0 * 4 = 0 \quad (39)$$

$$\rightarrow \lambda_1 = 1, \lambda_2 = 2. \quad (40)$$

$$\begin{pmatrix} 1 - 1 & 4 \\ 0 & 2 - 1 \end{pmatrix} = \begin{pmatrix} 0 & 4 \\ 0 & 1 \end{pmatrix} \mathbf{x}_1 = 0 \rightarrow \mathbf{x}_1 = \begin{pmatrix} p \\ 0 \end{pmatrix} \text{ for } p \in \mathbb{R} \quad (41)$$

 $\begin{pmatrix} 1-2 & 4 \\ 0 & 2-2 \end{pmatrix} = \begin{pmatrix} -1 & 4 \\ 0 & 0 \end{pmatrix} \mathbf{x}_1 = 0 \to \mathbf{x}_2 = \begin{pmatrix} q \\ \frac{1}{4}q \end{pmatrix} \text{ for } q \in \mathbb{R} \quad (42)$

Determinant not useful numerically, software packages use QR-Method.

Eigenvalue-Decomposition [Str+09]

Eigenvalues let us look into the heart of a square system-matrix $\mathbf{A} \in \mathbb{R}^{n,n}$.

$$\mathbf{A} = \mathbf{S} \begin{pmatrix} \lambda_1 & & & \\ & \lambda_2 & & \\ & & \ddots & \\ & & & \lambda_n \end{pmatrix} \mathbf{S}^{-1} = \mathbf{S} \wedge \mathbf{S}^{-1}, \tag{43}$$

with $\mathbf{S} \in \mathbb{C}^{n,n}$ and $\Lambda \in \mathbb{C}^{n,n}$.

Singular-Value-Decomposition [Str+09]

What about a non-square matrix $\mathbf{A} \in \mathbb{R}^{n,m}$? Idea:

$$\mathbf{A}^{\mathsf{T}}\mathbf{A} = \mathbf{V} \begin{pmatrix} \sigma_1^2 & & \\ & \ddots & \\ & & \sigma_n^2 \end{pmatrix} \mathbf{V}^{-1}, \mathbf{A}\mathbf{A}^{\mathsf{T}} = \mathbf{U} \begin{pmatrix} \sigma_1^2 & & \\ & \ddots & \\ & & \sigma_n^2 \end{pmatrix} \mathbf{U}^{-1}.$$

$$\tag{44}$$

Using the eigenvectors of the $\mathbf{A}^T\mathbf{A}$ and $\mathbf{A}\mathbf{A}^T$ we construct,

$$\mathbf{A} = \mathbf{U} \mathbf{\Sigma} \mathbf{V}^{T}, \tag{45}$$

with $\mathbf{A} \in \mathbb{R}^{m,n}$, $\mathbf{U} \in \mathbb{R}^{m,m}$, $\Sigma \in \mathbb{R}^{m,n}$ and $\mathbf{V} \in \mathbb{R}^{n,n}$.

Singular values and matrix inversion [GK65]

$$\mathbf{A}^{\dagger} = \mathbf{V} \mathbf{\Sigma}^{\dagger} \mathbf{U}^{T} = \mathbf{V} \begin{pmatrix} \sigma_{1}^{-1} & & \\ & \ddots & \\ & & \sigma_{m}^{-1} \end{pmatrix} \mathbf{U}^{T}$$
 (46)

Regularization via Singular Value Filtering

Originally we had a problem computing $\mathbf{A}^{\dagger}\mathbf{b}=\mathbf{x}.$ To solve it, we compute,

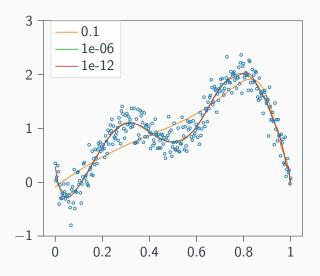

$$\mathbf{x}_{reg} = \sum_{i=1}^{n} f_i \frac{\mathbf{u}_i^T b}{\sigma_i} \mathbf{v_i}$$
 (47)

The filter factors are computed using $f_i = \sigma_i^2/(\sigma_i^2 + \epsilon)$. Singular values $\sigma_i < \epsilon$ are filtered. Expressing equation 47 using matrix notation:

$$\mathbf{x}_{reg} = \mathbf{VF} \begin{pmatrix} \sigma_1^{-1} & & & \\ & \ddots & & \\ & & \sigma_m^{-1} & \\ & & 0 \end{pmatrix} \mathbf{U}^T \mathbf{b}_{noise}$$
 (48)

with $\mathbf{A} \in \mathbb{R}^{m,n}$, $\mathbf{U} \in \mathbb{R}^{m,m}$, $\mathbf{V} \in \mathbb{R}^{n,n}$, diagonal $\mathbf{F} \in \mathbb{R}^{m,m}$, $\Sigma^{\dagger} \in \mathbb{R}^{n,m}$ and $\mathbf{b} \in \mathbb{R}^{n,1}$.

Regularized solution

Conclusion

- True scientists know what linear can do for them!
- Think about matrix shapes. If you are solving a problem, rule out all formulations where the shapes don't work.
- Regularization using the SVD is also known as Tikhonov regularization.
